

## *Stainless Steel Helical Gearboxes*

## **FRC Series Helical Gearboxes**

*FRC series helical gearboxes are being developed to achieve high torque, low energy use and less surface heat.*

*The high efficiency of the drive reduces the energy consumption.*

*The case hardened gears ensure a long lifetime and smooth running.*

*The smart design with a detachable footplate offers great flexibility to replace common used standards in the market.*

*The design of the gearbox is organic round and the smooth design makes the gearboxes extremely applicable in the food industry.*

*The FRC helical gearboxes offer ratios up to 54 : 1 with a maximum output torque of 300 Nm.*

### **The main features are:**

*Made of high quality carefully electro polished Stainless Steel AISI 316. (Mirror Polished on request)*

*The smooth design gives the gearbox a nice appearance, ready to suit all kinds of stainless steel machineries for the food industry.*

*All solid shafts are produced in Duplex Stainless Steel 2205.*

*The special PNS surface treatment ensures enough hardness to collaborate with our Special High Temperature Resistant Blue Shaft Seals.*

*The PNS treatment increases the lifetime of shaft / seal cooperation and helps to reduce wear on the shaft surface.*

*By this, the gearbox obtains a longer drip free operation compared to standard shaft / seal combinations made of SS304 with NBR or FKM.*

*The use of above combination offers all the positive characteristics of stainless steel and the surface hardness of a hardened shaft.*

*Our high performance engineered shaft seals have a Blue colour.*

*It is a well overthought feature for food industry applications.*

*It might be clear that the colour "Blue" is a not existing organic colour.*

*In the context of food safety it is a common use to embed blue colours as these are very visible and easily to be recognised by Vision scanning systems.*

*All gearboxes are standard equipped with NSH H1 certified Synthetic Foodgrade lubrication.*

*On request it can be supplied with a Halal, Kosher or Nut Free certification.*

*To avoid dirt traps under the commonly used motor identification tagplate,*

*all our motors and gearboxes are being equipped with a laser engraved tagplate.*

*Besides for the food safety this also prevents against possible lost of information because of taking away the tagplate or loosing the tagplate from the driveparts.*

*As a part of our standard procedure every drive is tested in our production facility in the Netherlands to ensure correct functioning.*

### **Properties and features :**

*Standard ratio's 3,66 : 1 to 54 : 1*

*IEC motor adaption*

*Standard solid shafts 20, 25 & 30 mm*

*Easy clean torque arm with built in elastic element to reduce alignment mistakes allows easy assembling of the gearbox on the machine shaft.*

*There is no need to laser cut and bend your own torque arm.*

*The Easy clean torque arm has a very open design. This design offers better cleanability during the standard cleaning cycle.*

*For flange mounted applications we offer several types of secondary output flanges in Electro Polished SS316.*

*As a problem solver we are happy to investigate the best possible solutions for our customers that fits their budget.*

Output Flanges

Under Development

## Power P

This parameter can be found in the gearbox selection tables and represents the amount kW that can be safely transmitted into the gearbox

$$P_1 = \frac{P_2}{\eta} [\text{kW}]$$

$$P_{1n} \geq P_1 \cdot f_s [\text{kW}]$$

- $P_1$       Input Power (kW)
- $P_2$       Output Power (kW)
- $P_{1n}$      Rated Input Power (kW)
- $f_s$       Service Factor
- $\eta$         Transmission Efficiency %

## Rotation Speed n

- $n_1$       Gear Units Input Speed
- $n_2$       Gear Units Output Speed

All stated values are based on an input speed of 1500 min<sup>-1</sup>.  
We strongly advise, to obtain the expected lifetime, not to exceed the maximum input speed.  
In case of a lower input speed the maximum input torque should be taken in consideration too.

## Transmission ratio i

$$i = \frac{n_1}{n_2}$$

## Torque M

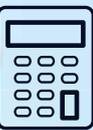

$$M_2 = \frac{9550 \cdot P_1 \cdot \eta}{n_2} [\text{Nm}]$$

$$M_{2n} \geq M_2 \cdot f_s [\text{Nm}]$$

- $M_2$       = Output Torque (Nm)
- $M_{2n}$     = Selected Output Torque (Nm)
- $P_1$       = Input Power (kW)
- $\eta$         = Transmission Efficiency %
- $f_s$       = Service Factor

## Efficiency of gear units

The efficiency of gear units is mainly determined by the gearing and bearing friction. Keep in mind that the starting efficiency of a gear unit is always less than its efficiency at operating speed. This factor is particularly distinctive for worm & helical worm gear boxes.  
The gearing in helical worm & worm gearboxes produces a high proportion of sliding friction.  
As a result these gearboxes have higher gear efficiency losses than other gearboxes and therefore have a lower total efficiency.  
A secondary result is that the surface temperature of these gearboxes will be higher than other gearboxes.  
The efficiency of the Dertec Stainless Steel gearboxes can be found in the possible geometrical combinations page's of each gearbox serie.

## Service Factor

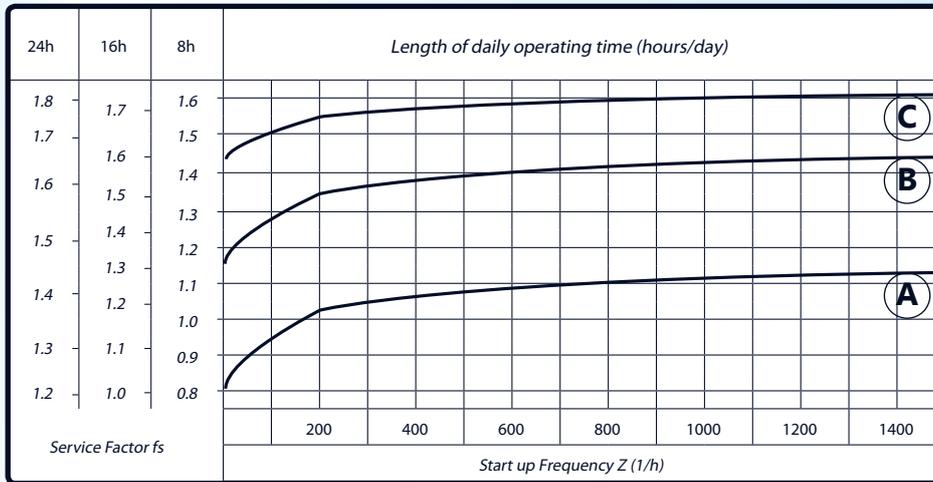

The effect of the driven machine on the gearbox is taken into account to a sufficient level of accuracy using the Service Factor  $f_s$ .

The Service Factor is determined according to the daily operating time and the starting frequency  $Z$ .

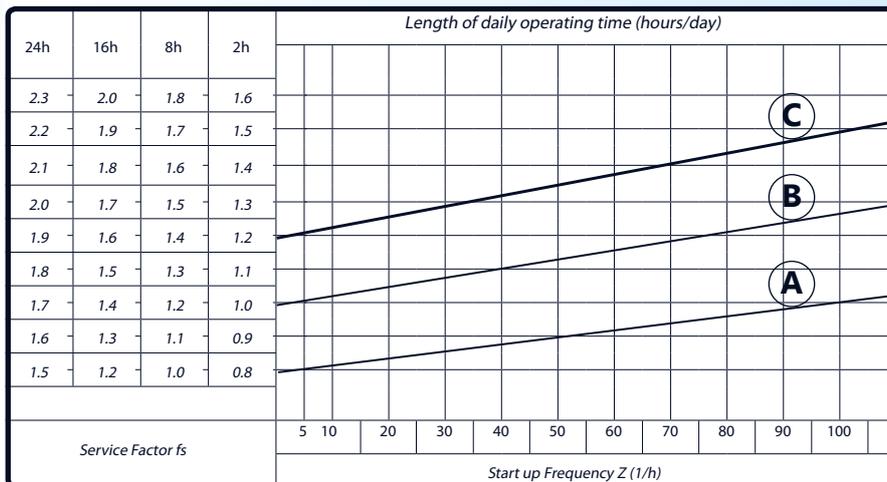

Three load classifications are considered depending on the mass acceleration factor.

You can read of the service factor applicable to your application in the figure below.

The service factor selected using this figure must be less than or equal to the service factor as given in the gearbox selection table.

## Service Factor for wormgearboxes

### Ambient temperature influence on the service factor for wormgearboxes

Service factor  $f_s$  should be adjusted as following

ambient temperature = 30 ~ 40 :  $f_s \times 1.1 \sim 1.2$

ambient temperature = 40 ~ 50 :  $f_s \times 1.3 \sim 1.4$

ambient temperature = 50 ~ 60 :  $f_s \times 1.5 \sim 1.6$

ambient temperature = > 60, please contact Dertec.

### Type of load:

**A**

Uniform load Permitted mass acceleration factor ( $f_a$ )  $\leq 0.3$

Screw feeders for light materials, fans, assembly lines, conveyor belts for light materials, small mixers, lifts, cleaning machines, fillers, control machines.

**B**

Moderate shock load Permitted mass acceleration factor ( $f_a$ )  $\leq 3$

Winding devices, woodworking machine feeders, goods lifts, balancers, threading machines, medium mixers, conveyor belts for heavy materials, winches, sliding doors, fertilizer scrapers, packing machines, concrete mixers, crane mechanism, milling cutters, folding machines, gear pumps.

**C**

Heavy Shock Load Permitted mass acceleration factor ( $f_a$ )  $\leq 10$

Mixers for heavy materials, shears, presses, centrifuges, rotating supports, winches and lifts for heavy materials, grinding lathes, stone mills, bucket elevators, drilling machines, hammer mills, cam presses, folding machines, turntables, tumbling barrels, vibrators, shredders.

**To maintain the service life of the gear units, the Service Factor mentioned in the gearbox selection table must be equal or slightly higher than the calculated service factor.**

## Mass Acceleration Factor

The Mass acceleration factor is calculated as follows:

$$f_a = \frac{J_c}{J_m}$$

$f_a$  = Mass Acceleration Factor

$J_c$  = All External Mass Moments Of Inertia [Kgm<sup>2</sup>]

$J_m$  = Mass Moment Of Inertia on the Motor End [Kgm<sup>2</sup>]

If the mass acceleration factor is  $f_a > 10$ , please contact us.

## Overhung and axial loads

### Determining overhung loads

An important factor for determining the resulting overhung load is the type of transmission element mounted to the shaft end. The following transmission element factors  $f_z$  have to be considered for various transmission elements.

| Transmission Element  | Transmission Element Factor Fz | Comments                       |
|-----------------------|--------------------------------|--------------------------------|
| Gears                 | 1.00                           | ≥ 17 Teeth                     |
|                       | 1.15                           | < 17 Teeth                     |
| Chain Sprockets       | 1.00                           | ≥ 20 Teeth                     |
|                       | 1.25                           | < 20 Teeth                     |
|                       | 1.40                           | < 13 Teeth                     |
| Narrow V-belt pulleys | 1.75                           | Influence of the tensile force |
| Flat Belt Pulleys     | 2.50                           | Influence of the tensile force |
| Toothed Belt Pulleys  | 2.50                           | Influence of the tensile force |

The overhung load exerted on the motor or gearshaft is calculated as follows

$$F_r = \frac{M \cdot 2000}{d_0} \cdot f_z$$

$F_r$  = Overhung load in N

$M$  = Torque in Nm

$d_0$  = Mean Diameter of the mounted transmission element in mm

$f_z$  = Transmission element factor

### Permitted overhung load

The basis for determining the permitted overhung loads is the calculation of the rated bearing service life  $L_{10h}$  of the roller bearings (according ISO281)

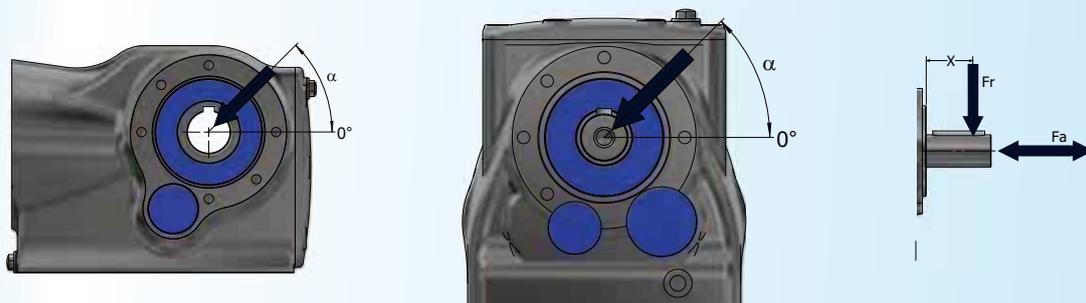

For special operating conditions, the permitted overhung loads can be determined with regard to the modified service life on request.

The values refer to force applied to the center of the shaft end (in right angle gear units as viewed onto drive end)

The values for the force application angle  $\alpha$  and direction of rotation are based on the most unfavorable conditions.

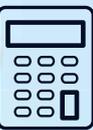

### Definition of force application

The force application is defined according to the following figure.

$F_x$  = Permitted overhung load at point x [N]

$F_a$  = Permitted axial load [N]

**Permitted axial forces**

If there is no overhung load, than an axial force  $F_a$  (Tension or Compression) amounting to 50% of the overhung load given in the selection tables is permitted.

**Overhung load conversion for off-center force application**

The permitted overhung loads must be calculated according to the selection tables using the following formula in the event that force is not applied at the center of the shaft end. Note that the calculations apply to  $M2_{max}$ .

**$F_{xl}$  based on bearing life:**

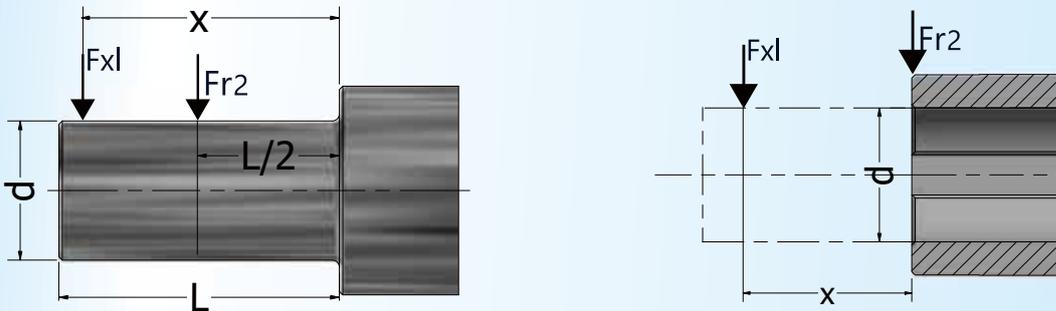

$$F_{xl} = F_{r2} \cdot \frac{a}{b + x} [N]$$

$F_{r2}$  = Permitted overhung load ( $x = L/2$ ) for foot mounted gear units according to the selection tables in [N]

$X$  = Distance from the shaft shoulder to the force application point in [mm]

$a, b$ , = Gear unit constant for overhung load conversions [mm]

The following figure shows the overhung load  $F_r$  with increased distance  $X$  to the gear unit.

Values of  $a$  &  $b$  in mm are given in the following table

| <b>FV</b>        | <b>a</b> | <b>b</b> | <b>FR</b>       | <b>a</b> | <b>b</b> |

## Efficiency & Irreversibility Characteristics

Efficiency is an important parameter of a wormgear reducer. Efficiency  $\eta$  depends on the following parameters:

- 1) Helix angle of gearing
- 2) Driving speed
- 3) Running in of gearing
- 4) The performance of the Lubricant, Oil Seals and Bearings.

The Mesh table shows the dynamic efficiency ( $\eta_1=1400$ ) and static efficiency values. Remember that these values are only achieved after the unit has been operating for ca. 24 hours. "Run in period" Torque values  $M_{2n}$  indicated in the gearbox selection tables are calculated by considering the steady state performance of the gearboxes. The actual values mentioned could have deflection.

### Dynamic Irreversibility

Dynamic Irreversibility is achieved when the output shaft stops instantly when power is no longer transmitted through the wormshaft. This condition requires a dynamic efficiency of  $\eta_d < 0.4$ . See mesh table.

| $\eta_d$                       | > 0.6                 | 0.5 ~ 0.6                 | 0.4 ~ 0.5                    | < 0.4                   |
|--------------------------------|-----------------------|---------------------------|------------------------------|-------------------------|
| <b>Dynamic irreversibility</b> | Dynamic reversibility | Low Dynamic reversibility | Good Dynamic irreversibility | Dynamic irreversibility |

### Static Irreversibility

Static Irreversibility is achieved when, at a standstill, the application of a load to the output shaft can't drive the wormshaft of the gear reducer. This condition requires a static efficiency of  $\eta_s < 0.5$ . See mesh table.

| $\eta_s$                      | > 0.55               | 0.5 ~ 0.55               | < 0.5                  |
|-------------------------------|----------------------|--------------------------|------------------------|
| <b>Static irreversibility</b> | Static reversibility | Low Static reversibility | Static irreversibility |

The table shows approximate irreversibility classes. Vibrations and shocks can effect a gear reducers irreversibility. As it is virtual impossible to provide and guarantee total non reversing, we recommend the use of an external brake with sufficient capability to prevent vibrations in duced starting, where these circumstances are required. For the irreversibility conditions of a combined geared unit one must consider that the efficiency of the group is given by the product of the efficiencies of each single reducer, i.e.:  $N_{tot} = N1 \times N2$

## Mesh Data

|               | <b>i</b>  | <b>7,5</b> | <b>10</b> | <b>15</b> | <b>20</b> | <b>25</b> | <b>30</b> | <b>40</b> | <b>50</b> | <b>60</b> | <b>80</b> | <b>100</b> |
